

Hialurina[®]

Eye drops, artificial tears. Canines, felines and horses.

Formula:

100 mL contain:

Sodium Hyaluronate 0.30 g

Excipients qs 100.00 mL

Indications:

HIALURINA is indicated for eye conditions characterized by low tear production, such as: keratoconjunctivitis sicca, pannus, or surgical procedures where tear production is diminished or stopped.

It can also be used to treat external inflammatory symptoms in the eye caused by excessive dryness, exposure to wind, sun or irritating agents.

Dosage and Directions for Use:

Hialurina should be used 2-6 times a day; however, in serious cases, frequency of application must be established by the treating veterinarian, according to the severity of the case. The duration of treatment should also be established by the treating veterinarian.

Directions for Use: Hialurina is administered only in the eye. To ensure ease of administration, one hand should be placed on the patient's forehead, while holding the dropper containing the medication 1-2 cm above the conjunctival sac. Holding the forehead and keeping the dropper at a safe distance prevents both injuries to the eye and contamination of the dropper. Drop the medication on the conjunctival sac located in the corner of the eye.

Package:

10 mL Bottle.
