

Pulicide, adulticide, and larvicide pipette for felines.

**Formula:**

Imidacloprid ..... 10,0 g  
Methoprene ..... 4,8 gr.  
Formulation Agents q.s. .... 100,00 ml

**Indications:**

Power Met is indicated for the prevention and treatment of flea infestation of cats (*Ctenocephalides felis*, *Ctenocephalides canis*), from 10 weeks of age or 2.5 kg in weight.

**Dose and how to use:**

This product is for external use. Apply the entire content on the length of the neck between the back of the head and the beginning of the upper back, by separating the hair and placing the pipette on the skin. Application of this product is recommended with the animal standing up. Coat must be dry. Avoid contact with the animal's eyes and mouth.

**Felines up to 4 kg: 1 pipette with 0.5 ml.**

**Felines between 4 and 8 kg: 1 pipette with 1.0 ml.**

One application of this product acts as pulicide preventing infestation with fleas for a variable period, according to the infestation of the environment. Residual power reaches 5 weeks in environments with moderate infestation, and up to 4 weeks (28 days) in environments with high infestation. Medicated or hygienic baths, or an intense exposure to rain, can decrease the effectiveness or shorten the time of residuality of the product. Therefore, if the animal is frequently bathed or has been exposed to heavy rain, it is advisable to repeat the treatment.

The treatment must be maintained during the time that is needed, as long as there is infestation by fleas or according to the veterinarian's criteria.

**Presentation:**

Inviolable plastic case with pipette according to animal's weight:

Cats up to 4 kg: pipette with 0.5 ml.

Cats from 4 to 8 kg: pipette with 1 ml.
